AI-Powered Social Impact Campaign System

Final Project Documentation

Campaign: Digital Detox Week – Reclaim Your Mind
Completed Tasks: Task 1 — AI Prompting System | Task 2 — Visual AI System | Task 3 — Automated Participation & Awareness System
Overall status: COMPLETE

Project Summary

This project combines structured AI prompting, AI-generated visual storytelling, and n8n automation to create an ethical digital awareness campaign. The campaign focuses on the distinction between intentional screen use and automatic scrolling, using the participation mechanism: **NOTICE ONE AUTOMATIC HABIT → CHOOSE ONE SMALL BOUNDARY → EXPERIMENT WITH IT.**

The work was completed through three connected tasks: Task 1 created the campaign strategy and messaging; Task 2 translated that strategy into a six-scene visual narrative; Task 3 created an automated participant-handling workflow using n8n and Google Sheets.

1. Project Overview & System Architecture

Task	What was built	Final outcome
Task 1 — AI Prompting System	Audience emotional mapping, AWARE framework, campaign generation, evaluation and two refinements.	Final ethical, awareness-driven campaign message.
Task 2 — Visual AI System	Six-scene AI visual narrative, locked character/style, three documented refinements.	Final six-scene campaign storyboard.
Task 3 — Automation System	Form → Google Sheets → Switch → Email → Action Log using n8n.	Working participant classification and response workflow.

End-to-end flow

Audience insight → Ethical campaign message → Six-scene visual story → Participant form → Automated classification → Personalized awareness email → Action log

Source alignment

The supplied Task 1 document defines the campaign flow from audience mapping through final campaign refinement. The supplied Task 2 document defines the six-scene visual progression and refinement process. The supplied Task 3 document defines the automation components, classification rules, testing and Action Log.

2. Task 1 — AI Prompting System

Objective

Task 1 designed a structured AI prompting system that understands audience behaviour and emotions, converts those insights into campaign messaging, controls emotional intensity, and maintains ethical guardrails.

Audience Emotional Mapping

Stage	Purpose	Key insight
1. Behavioural Patterns	Identify observable screen-use behaviours.	Automatic app opening, scrolling beyond intention, frequent checking, filling idle
2. Emotional Consequences	Identify possible emotional experiences.	Mental distraction, frustration, difficulty switching off, possible regret, social pres
3. Triggers	Identify cues and situations.	Notifications, boredom, difficult tasks, phone availability, recommendations, tran
4. Internal Conflicts	Identify intention vs actual behaviour.	Wanting to focus but checking; wanting a short break but continuing to scroll; wa
5. Motivational Levers	Identify voluntary reasons to experiment with change.	Greater control, intentional breaks, awareness, focused time, intentional relaxati

Central audience insight

People may not want to eliminate technology; they may want to feel more intentional about when and why they use it. The recurring creative territory became **choice vs. automatic habit**.

AWARE framework

Letter	Meaning	Role
A	Audience Context	Defines audience and legitimate screen uses.
W	Walk in Their Experience	Uses behaviour, emotion, triggers, conflicts and motivations.
A	Ethical Awareness Guardrails	Prevents fear, shame, guilt, manipulation, unsupported claims and forced disconnection.
R	Regulated Emotional Progression	Recognition → Reflection → Realization → Possibility → Empowerment.
E	Expected Structured Output	Headline, narrative ≤350 words, 3 awareness statements, compassionate CTA and ethical chec

3. Task 1 — Campaign Development & Refinement

Initial campaign

Headline: “You Don’t Have to Disconnect. Just Reconnect With What Matters.”

The initial version used a familiar study/work situation where a quick phone check becomes extended scrolling. It acknowledged legitimate technology use and invited small voluntary experiments.

Meta-critique

The critique found the campaign ethically strong and structurally aligned with AWARE. The main opportunity was distinctiveness and emotional specificity. The strongest territory was choice versus automatic habit. The refinement priorities were to make the intention-versus-behaviour gap more recognizable, use researched triggers more deliberately, simplify participation, and preserve ethical boundaries.

Refinement #1

Headline: “Is Your Next Scroll a Choice — or Just a Habit?”
Central idea: CHOICE vs. AUTOMATIC HABIT
Participation: NOTICE ONE AUTOMATIC HABIT → CHOOSE ONE SMALL BOUNDARY → EXPERIMENT WITH IT

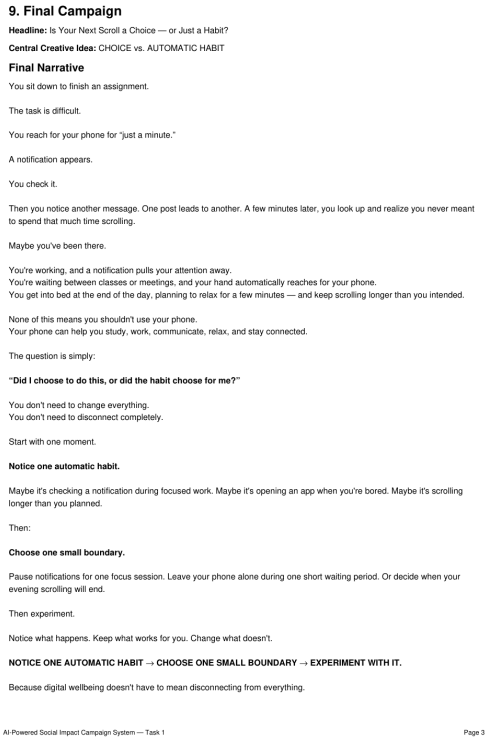

Refinement #2 — Final Quality Check

The final quality pass confirmed strategic alignment, audience alignment, emotional quality, message clarity, headline quality, narrative quality, awareness statements, CTA quality and ethical safety. The final wording changed “Notice the moment your intention changes into an automatic scroll” to “Notice when a quick check becomes an automatic scroll.”

Final campaign

Headline: Is Your Next Scroll a Choice — or Just a Habit?
Central creative idea: CHOICE vs. AUTOMATIC HABIT

Final participation mechanism: NOTICE ONE AUTOMATIC HABIT → CHOOSE ONE SMALL BOUNDARY → EXPERIMENT WITH IT

9. Final Campaign

Headline: Is Your Next Scroll a Choice — or Just a Habit?

Central Creative Idea: CHOICE vs. AUTOMATIC HABIT

Final Narrative

You sit down to finish an assignment.

The task is difficult.

You reach for your phone for “just a minute.”

A notification appears.

You check it.

Then you notice another message. One post leads to another. A few minutes later, you look up and realize you never meant to spend that much time scrolling.

Maybe you’ve been there.

You’re working, and a notification pulls your attention away.
You’re waiting between classes or meetings, and your hand automatically reaches for your phone.
You get into bed at the end of the day, planning to relax for a few minutes — and keep scrolling longer than you intended.

None of this means you shouldn’t use your phone.
Your phone can help you study, work, communicate, relax, and stay connected.

The question is simply:

“**Did I choose to do this, or did the habit choose for me?**”

You don’t need to change everything.
You don’t need to disconnect completely.

Start with one moment.

Notice one automatic habit.

Maybe it’s checking a notification during focused work. Maybe it’s opening an app when you’re bored. Maybe it’s scrolling longer than you planned.

Then:

Choose one small boundary.

Pause notifications for one focus session. Leave your phone alone during one short waiting period. Or decide when your evening scrolling will end.

Then experiment.

Notice what happens. Keep what works for you. Change what doesn’t.

NOTICE ONE AUTOMATIC HABIT → CHOOSE ONE SMALL BOUNDARY → EXPERIMENT WITH IT.

Because digital wellbeing doesn’t have to mean disconnecting from everything.

AI-Powered Social Impact Campaign System — Task 1 Page 3

Figure 1. Final campaign narrative and participation mechanism from the supplied Task 1 documentation.

4. Task 1 — Ethical Positioning, Learnings & Limitations

Principle	Final approach
Autonomy	Participants choose their own habit, boundary and experiment.
No fear / shame / guilt	Uses recognition and reflection rather than negative emotional pressure.
No manipulation	Invites voluntary experimentation rather than exploiting vulnerability.
No unsupported claims	No medical, mental-health, guaranteed wellbeing or guaranteed productivity claims.
Technology is not inherently bad	Recognizes study, work, communication, relaxation and entertainment uses.
No complete-disconnection demand	Explicitly says people do not need to disconnect completely.

Key learnings

Prompt chaining created a progressive audience model. The intention-versus-behaviour gap provided a more specific creative foundation than generic “reduce screen time” messaging. Ethical guardrails were built into the framework, meta-critique identified weaknesses before refinement, and two refinements demonstrated iterative improvement.

Limitations

The audience mapping describes possible behaviours and emotional experiences rather than universal experiences. The campaign does not claim that screen use causes specific medical or mental-health outcomes, and it does not guarantee a personal outcome.

5. Task 2 — Visual AI System

Objective & required progression

Task 2 transformed the Task 1 awareness campaign into a six-scene visual narrative using AI-generated imagery. The required progression was **Overstimulation** → **Emotional Fatigue** → **Realization** → **Contrast** → **Positive Transformation** → **CTA**.

Locked visual identity

Element	Locked direction
Protagonist	Ananya, 21-year-old Indian college student; medium-brown skin; long straight dark-black hair; brown eyes; rectangular gla
Photography	Photorealistic cinematic advertising photography.
Environment	Modern Indian college, library and campus spaces.
Lighting	Natural realistic indoor/outdoor lighting.
Composition	Premium commercial framing with useful negative space where appropriate.
Tone	Reflective, realistic and hopeful; no fear or shame.
Message principle	Awareness → Choice → Experimentation.

Six-scene architecture

Scene	Purpose
1. Overstimulation	Show automatic checking and repeated digital distraction during study.
2. Emotional Fatigue	Show difficulty settling back into the intended activity.
3. Realization	Show a reflective pause and awareness of the habit.
4. Contrast	Show an intentional offline moment and life beyond the screen.
5. Positive Transformation	Show a small chosen boundary supporting focused activity.
6. CTA	Invite participation in Digital Detox Week through a calm, choice-based visual.

6. Task 2 — Final Six-Scene Storyboard

The supplied Task 2 documentation identifies the six final selected visuals after the refinement process.

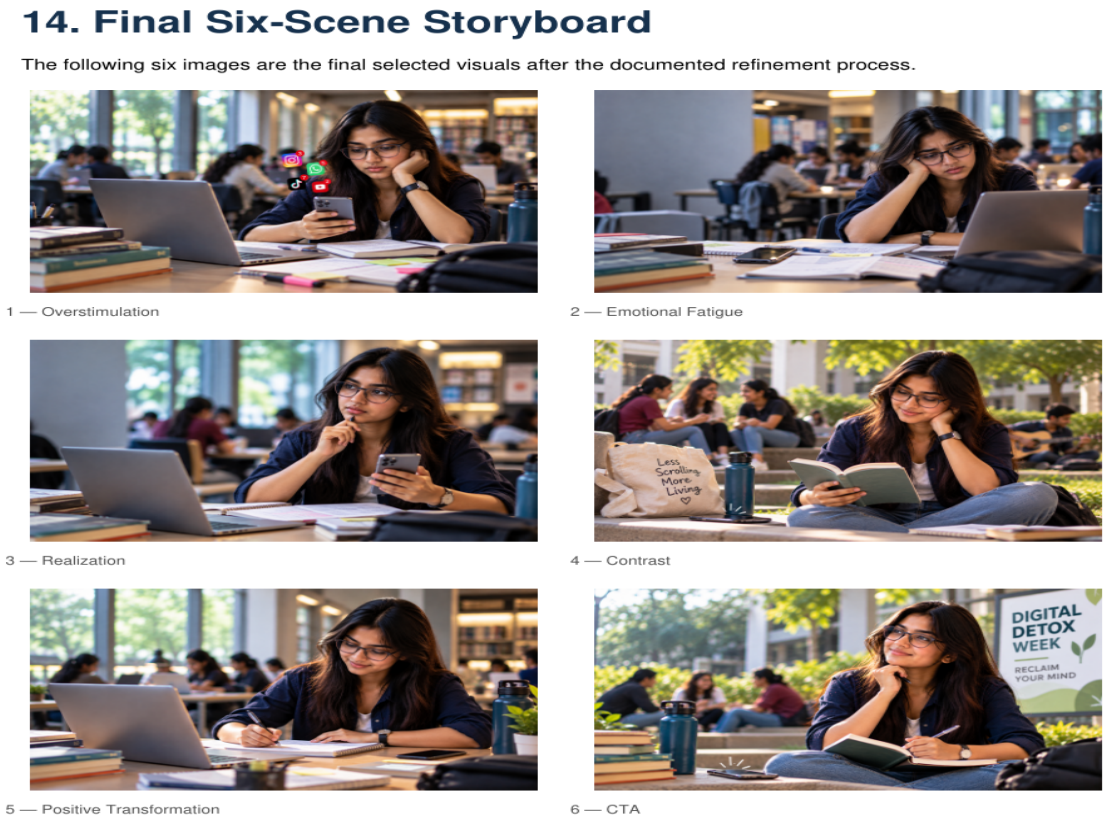

Figure 2. Final six-scene storyboard: Overstimulation, Emotional Fatigue, Realization, Contrast, Positive Transformation and CTA.

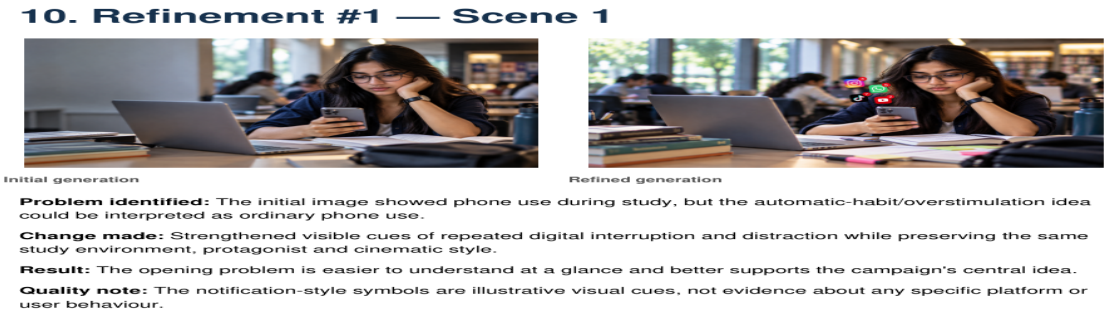

Visual progression

AUTOMATIC SCREEN BEHAVIOUR → EMOTIONAL DISTRACTION → SELF-AWARENESS → INTENTIONAL OFFLINE CHOICE → FOCUSED ACTIVITY → CAMPAIGN PARTICIPATION

7. Task 2 — Refinement Process

Refinement #1 — Scene 1

Problem: ordinary phone use did not make the automatic-habit/overstimulation idea clear enough. Change: strengthened visible cues of repeated digital interruption while preserving the same study environment, protagonist and cinematic style. Result: the opening problem became easier to understand at a glance.

Refinement #2 — Scene 4

Problem: the calm moment did not create enough contrast with screen-focused behaviour. Change: made the phone visibly secondary, added a clearer offline activity and strengthened the campus environment. Result: the contrast stage became clearer.

11. Refinement #2 — Scene 4

Initial generation

Refined generation

Problem identified: The original scene was calm, but the contrast with screen-focused behaviour was not visually strong enough.

Change made: Make the phone visibly secondary, add a clearer offline activity, and strengthen the social/campus environment around Ananya.

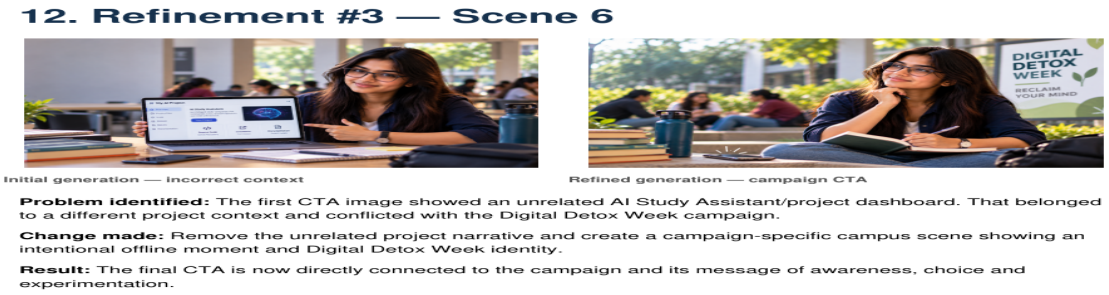

Result: The scene now more clearly represents intentional offline attention and the contrast stage of the narrative.

Quality note: The refined image contains incidental AI-generated text on a tote bag. That wording is not official campaign copy and should be cropped/covered in final advertising artwork.

8. Task 2 — Refinement #3, Learnings & Quality Controls

Refinement #3 — Scene 6

Problem: the first CTA accidentally showed an unrelated AI Study Assistant/project dashboard. Change: removed the unrelated project narrative and created a campaign-specific Digital Detox Week campus scene. Result: the CTA became directly connected to the campaign.

Refinement loop

GENERATE → REVIEW → IDENTIFY MISMATCH → REFINE → RE-REVIEW → LOCK

Review criteria included narrative clarity, character continuity, campaign relevance, ethical tone, visual quality and text quality.

Important quality consideration

The supplied Task 2 document notes that Scene 4 contains incidental AI-generated tote-bag wording that is not official campaign copy and should be cropped or covered in final advertising artwork. It also notes that AI-generated typography can be inaccurate and should be controlled separately.

Key learning

A first AI image should be treated as a draft. Consistency needs explicit controls, narrative purpose matters more than attractiveness, ethical campaigns require emotional restraint, and refinement is part of the AI workflow.

9. Task 3 — Automated Participation & Awareness System

Objective

Task 3 created an automated participant-handling system for Digital Detox Week. A form submission is stored, classified into a screen-time category, followed by an appropriate awareness email, and recorded in an Action Log.

Form fields

Field	Value captured
Name	Participant name
Age Group	Age-group selection
Average Daily Screen Time	Reported average screen-time hours per day
Email	Participant email address
Would you participate in Digital Detox Week?	YES / NO / MAYBE

Classification logic

Category	Rule	Workflow action
High Risk	8+ hours	High Risk response → email → Action Log
Moderate	4–8 hours	Moderate response → email → Action Log
Low Risk	<4 hours	Low Risk response → email → Action Log

Final workflow

On form submission → Append row in sheet → Switch → Edit Fields → Send an Email → Append row in Action Log

The Switch creates three category branches: High Risk, Moderate and Low Risk.

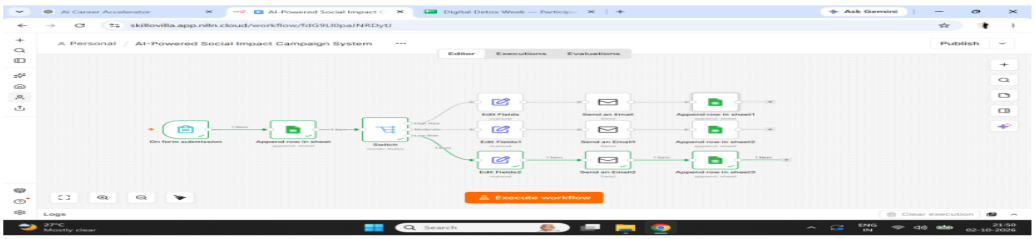

Figure 1. Final n8n workflow showing the form trigger, Google Sheets storage, Switch routing, three risk branches, email nodes, and Action Log nodes.

Figure 3. Final n8n workflow screenshot.

10. Task 3 — Email Automation, Action Log & Testing

Email automation

Each risk branch contains its own Send an Email node. The To Email field uses the participant's dynamic Email value. The tested subject was “Digital Detox Week — Your Screen-Time Awareness.”

Action Log

The Action Log records Name, Email, Category, Action Taken and Timestamp. During testing, the action was recorded as Email Sent for all three categories.

6. Branch Configuration

Branch	Category Value	Purpose
High Risk	High Risk	Awareness response for participants reporting 8+ hours.
Moderate	Moderate	Awareness response for participants reporting 4–8 hours.
Low Risk	Low Risk	Awareness response for participants reporting less than 4 hours.

7. Email Automation

Each risk branch contains its own Send an Email node. The To Email field uses the participant's dynamic Email value, so the response is sent to the person who submitted the form. The tested subject was **Digital Detox Week — Your Screen-Time Awareness**.

8. Action Log

The Action Log records Name, Email, Category, Action Taken, and Timestamp. During testing, the action was recorded as **Email Sent** for all three categories.

Action Log Screenshot — Testing Evidence

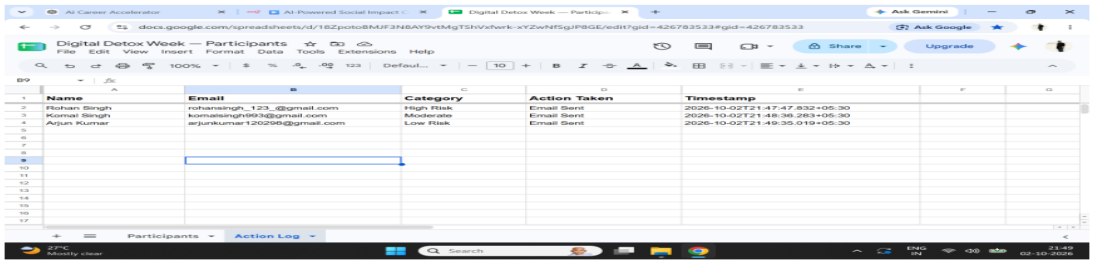

Figure 2. Action Log showing successful High Risk, Moderate, and Low Risk test entries with Email Sent recorded.

Figure 4. Google Sheets Action Log showing High Risk, Moderate and Low Risk test entries with Email Sent recorded.

Testing results

Test	Category	Result
Test 1	High Risk	PASS — Email Sent and logged
Test 2	Moderate	PASS — Email Sent and logged
Test 3	Low Risk	PASS — Email Sent and logged

9. Testing & Results

All three defined screen-time categories were tested separately. Each test reached the correct branch, sent the corresponding email, and created an Action Log entry.

Test	Category	Result
Test 1	High Risk	PASS — Email Sent and logged
Test 2	Moderate	PASS — Email Sent and logged
Test 3	Low Risk	PASS — Email Sent and logged

10. Problem Solved During Implementation

The email node initially displayed **"No recipients defined."** The To Email field was corrected to use the participant's dynamic Email field. The node then executed successfully and showed the recipient in the accepted output.

11. Key Learnings

- A form trigger can start an end-to-end automation.
- Google Sheets can store participant data and action history.
- A Switch node can route data into different paths using rules.
- Edit Fields nodes can transform incoming data into category and response values.
- Dynamic expressions such as {{$json["Email"]}} allow the workflow to use the current participant's email.
- Each branch should be tested separately.
- An Action Log provides clear evidence of completed automation actions.

12. Limitations

- Screen time is self-reported; the workflow does not independently measure device usage.
- The three categories are campaign-defined segments, not medical or psychological diagnoses.
- Email delivery depends on the configured SMTP service and recipient address.
- The workflow logs actions but does not provide a larger analytics dashboard.

13. Viva Preparation

Question	Simple Answer
What is Task 3?	An automated participant-handling system for Digital Detox Week.
Why n8n?	To connect the form, Sheets, classification, email, and logging in one workflow.
Why Switch?	To route participants according to their screen-time category.
Why Edit Fields?	To create category and response values used by later nodes.
Why Google Sheets?	To store participant data and action records.
How did you test it?	I tested High Risk, Moderate, and Low Risk separately and verified email and Action Log results.
What debugging issue did you face?	The email node initially had no recipient mapping; I fixed it using the participant's dynamic Email field.

14. Conclusion

Task 3 successfully implements the automation layer of the Digital Detox Week campaign. Participant submissions are captured, stored, classified into the three defined screen-time categories, sent a corresponding awareness email, and recorded in the Action Log. All three category paths were tested successfully.

SkilloVilla | AI-Powered Social Impact Campaign System | Task 3 Page 5

Figure 5. Testing and results evidence from the supplied Task 3 documentation.

11. Task 3 — Debugging, Learnings & Limitations

Debugging issue solved

The email node initially displayed **“No recipients defined.”** The To Email field was corrected to use the participant's dynamic Email field. The node then executed successfully and showed the recipient in the accepted output.

Key learnings

A form trigger can start an end-to-end automation. Google Sheets can store participant data and action history. A Switch node can route data using rules. Edit Fields can transform incoming data. Dynamic expressions such as **{{$json["Email"]}}** allow the workflow to use the current participant's email. Each branch should be tested separately, and an Action Log provides clear evidence of completed automation actions.

Limitations

Screen time is self-reported; the workflow does not independently measure device usage. The three categories are campaign-defined segments, not medical or psychological diagnoses. Email delivery depends on the configured SMTP service and recipient address. The workflow logs actions but does not provide a larger analytics dashboard.

12. Final Integrated System

Layer	Input	AI / Logic	Output
Strategy	Audience behaviours, emotions, triggers, conflicts, motivations	Persona + Claude AWARE + meta-critique + refinement	Ethical campaign message
Visual	Final campaign idea and participation mechanism	Stable Diffusion image generation + refinement	Consistent visual narrative
Automation	Participant form submission	n8n classification + branching + email + logging	Participant response and action record

Final campaign identity

Campaign: Digital Detox Week – Reclaim Your Mind
Headline: Is Your Next Scroll a Choice — or Just a Habit?
Central idea: CHOICE vs. AUTOMATIC HABIT
Participation: NOTICE ONE AUTOMATIC HABIT → CHOOSE ONE SMALL BOUNDARY → EXPERIMENT WITH IT

Overall learnings

The project demonstrates a complete AI-assisted campaign workflow: first understand the audience, then create and refine ethical messaging, translate the message into a consistent visual story, and finally connect participation to an operational automation system. The strongest lesson across all three tasks is that AI output needs structure, review, refinement and explicit quality controls.

Final status

TASK 1 — COMPLETE | TASK 2 — COMPLETE | TASK 3 — COMPLETE

Project 3 — AI-Powered Social Impact Campaign System: COMPLETE

13. Viva / Presentation Quick Answers

Question	Answer
What did you build?	An AI-powered social impact campaign system combining prompting, visual AI and n8n automation.
What is the campaign idea?	Choice versus automatic habit.
Why prompt chaining?	Each stage builds on the previous stage: behaviour → emotion → trigger → conflict → motivation.
What is AWARE?	Audience Context, Walk in Their Experience, Ethical Awareness Guardrails, Regulated Emotional Progres
Why six scenes?	They follow the required progression: Overstimulation, Emotional Fatigue, Realization, Contrast, Positive T
How did you maintain visual consistency?	By locking Ananya's identity, wardrobe family, environment, lighting, cinematic photography style and emo
Why refine three scenes?	The task required at least three refinements, and each refinement corrected a specific communication or c
Why n8n?	To connect the form, Google Sheets, classification, email and logging into one workflow.
Why Switch?	To route participants according to screen-time category.
How did you test Task 3?	High Risk, Moderate and Low Risk were tested separately; each sent the email and created an Action Log
What debugging issue did you solve?	The email node initially had no recipient mapping; it was fixed using the participant's dynamic Email field.

Final statement for presentation

“I built the project in three connected layers: Task 1 created the ethical campaign strategy, Task 2 converted that strategy into a six-scene visual narrative, and Task 3 automated participant handling using n8n and Google Sheets. I used iteration and testing at each stage instead of treating the first AI output as final.”
